FOREWORD (Nontechnical summary)

This report describes a numerical integration program much like the amended form of NUMIT-ONE but written for the SDS 920, a faster and larger computer. While the flow chart is identical to the amended version of NUMIT-ONE, the coding has taken advantage of the more flexible SDS FORTRAN II and the input and output devices have been changed to paper tape since this is standard equipment for SDS 900 series computers and a card read-punch is not available for our SDS 920.

ABSTRACT

An amendment to NUMIT-ONE is presented. The program utilizes Simpson's Rule to perform integration over any closed intervals on the SDS 920.

I. INTRODUCTION

NUMIT-ONE, originally coded for the IBM 1620, has now been recoded for the SDS 920. The code follows the flow chart given in the NUMIT-ONE amendment. ^{1,2}
The code itself approximately duplicates the IBM 1620 code; the only changes being those to take advantage of SDS FORTRAN II and input/output instructions. Familiarity with both of the previous publications is assumed.

Equipment needed:

FORTRAN II Processor

SDS 920 with minimum 4 K memory

While it has not been attempted, this program could probably be compiled and run on a smaller SDS computer of the 900 series.

II. ACCURACY

Floating point quantities in the 920 are held to approximately 12 digits unlike the IBM 1620 where variable precision parameters are possible. Generally, one can obtain six significant figures, the maximum output precision now called for.

Proper analysis prior to attempting to integrate, e.g., plotting data to visually select subintervals of integration, will have the double benefit of improving accuracy and reducing machine time. The test case in Appendix B illustrates this. On the first run the total interval was broken into three parts, with each subinterval carefully chosen so that unnecessary extremes would not be reached in any interval and the results for the parts were summed after the three passes. The result is an answer accurate to approximately six significant figures in a few minutes of machine time.

One can integrate over the entire interval in cases when time for analysis is short; that is, when plotting and other manual analysis is not possible. However, the second run of the test case in Appendix B using the entire interval method took over twice as much machine time and the result was slightly less accurate than the previous run after 14 iterations. Analysis is important when time permits.

A word of caution about the limits of integration: a situation in which the program will break down occurs when integrating over an interval where the integrand takes on both positive and negative values and produces an integral close to zero. In such cases, significant figures will be lost during integrating and DELTA J will exhibit a wild behavior instead of converging rapidly as it should. In a case like this, it is best to split the integrand into at least two parts, each containing a nonzero part of the total integral.

III. INPUT LIMITATIONS

Input limitations are the same as for the amended NUMIT-ONE for the IBM 1620 with one exception. J_{max} for this version must not be more than 24 due to limits on the size of fixed point quantities in SDS FORTRAN II. Generally this allows for more iterations than one would be willing to use.

The integrand, f(x), is provided by a subprogram of the FUNCTION type called FUN (X,N). X, computed in the main program, is the value of X when the function is called on; N^* is the 'pass number'. FUN must appear on the left of an arithmetic statement equivalent to the integrand in the subprogram before returning to the main program.

^{*} The integral is evaluated over several separate X regions as a sum of several independent integrals over disjoint regions; the integer variable describing the separate integrals is N.

IV. INPUT AND OUTPUT FORMATS

Input Format

Input is by paper tape. The following quantities are specified in the input (floating point quantities are in lower case, fixed point quantities in upper case).

a = lower limit of interval

b = upper limit of interval

 J_{max} = maximum number of iterations desired

 Δ = convergence criterion (floating point)

Line 1

Alpha Identification. Reproduced in the output and does not affect processing. Up to 80 characters permitted.

Line 2

Integrand Specification. Contains alphanumeric information to identify integrand in output. This does not affect processing. Up to 48 characters permitted.

Line 3		Format
Columns 1-11	a	E 11.6
Columns 12-22	b	E 11.6
Columns 23-25	J _{max}	I 3
Columns 26-33	Δ	F 8.6
Columns 34-35	Switch	F 2.0

Following line 3 may be any number of additional lines with new values of a, b, J_{max} , and Δ punched according to the same formats. If more lines follow, switch must be punched. If no lines follow, switch should not be punched. In the last line, switch must not be punched.

Errors in Input

All the error checks listed in AFRRI SR65-1 are made, with one change. J_{max} is permitted to be as high as 24 instead of 11 before an error message will be punched and the computer halts.

Output Format

Output is identical to the amended form of NUMIT-ONE for the IBM 1620, the only change being that output is on paper tape rather than cards.

Two sample listings are in Appendix B.

V. OPERATION

Operation is routine. The standard FORTRAN II compiler is used and no switches are utilized.

APPENDIX B

Test Case

Running time is still highly variable and depends strongly on the integrand. However, time is much shorter than on the IBM 1620. No case is known which is not at least 15 times as fast on the SDS 920 as on the other computer, the ratio being highest when the number of iterations is large. The formula given in the previous reports,

$$t = K \cdot 2^{Jact}$$

where K is a constant dependent on the integrand, still appears to be valid when the number of iterations is large enough so the time spent computing is large compared to the time spent punching tape.

The function illustrated here,

$$f(x) = x^7 \frac{\sqrt{1-x^2}}{(2-x)^{13/2}}$$

has been the most difficult tested thus far. It converges slower and the value of $K(7.47 \times 10^{-4} \text{ sec})$ is larger than any heretofore reported. Figure 1 illustrates the function over the intervals of -1 to 1. Running time for RUN 1 was 5.5 minutes; RUN 2 took 12.25 minutes.

KEY WORDS	LIN	KA	LIN	КВ	LIN	K C
	ROLE	wT	ROLE	WT	ROLE.	WT.
	1					
						•

- 1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.
- 2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" ia included. Marking is to be in accordance with appropriate security regulations.
- 2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.
- 3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.
- 4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.
- 5. AUTHOR(S): Enter the name(a) of author(s) as shown on or in the report. Enter leat name, first name, mlddle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.
- 6. REPORT DATE: Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.
- 7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pagea containing information.
- 7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.
- 8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.
- 8b, 8c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.
- 9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.
- 9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).

- 10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:
 - "Qualified requesters may obtain copies of this report from DDC."
 - (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
 - (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users ahall requeat through
 - (4) "U. S. milltary agencies may obtain copies of this report directly from DDC. Other qualified users shall request through
 - (5) "All distribution of this report is controlled. Qualified DDC users shall request through

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known

- 11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.
- 12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (paying for) the reaearch and development. Include address.
- 13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Idenfiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
